## Status of this Memo

This memo provides information to the network and systems management community. This memo is intended as a contribution to ongoing work in the area of multi-protocol management coexistence and interworking. This memo is part of a package of ISO/CCITT and Internet Management Coexistence (IIMC) drafts; see also [IICMIMIBTRANS] [IIMCOMIBTRANS] [IIMCPARTY] [IIMCPROXY].

This document is an Internet Draft. Internet Drafts are working documents of the Internet Engineering Task Force (IETF), its Areas, and its Working Groups. Note that other groups may also distribute working documents as Internet Drafts.

Internet Drafts are draft documents valid for a maximum of six months. Internet Drafts may be updated, replaced, or obsoleted by other documents at any time. It is not appropriate to use Internet Drafts as reference material or to cite them other than as a "working draft" or "work in progress".

Please check the 1id-abstracts.txt listing contained in the internet-drafts Shadow Directories on nic.ddn.mil, nnsc.nsf.net, nic.nordu.net, ftp.nisc.sri.com,munnari.oz.au to learn the current status of any Internet Draft.

Distribution of this memo is unlimited. Comments on this memo should be sent to iimc@thumper.bellcore.com by November 20, 1992.

**Abstract**

This memo is intended to facilitate the multi-protocol management coexistance and interworking for networks that are managed using the OSI Common Management Information Protocol (CMIP) and networks that are managed using the Simple Network Management Protocol (SNMP). This RFC contains the OSI definition and registration of the OSI Proxy MIB-II as derived from the Internet MIB-II [RFC1213] according to the procedures defined in "Translation of Internet MIBs to OSI GDMO MIBs" [IIMCIMIBTRANS]. In addition, it includes the IP Forwarding Table defined in [RFC1354].

## 1. Introduction

The past decade has witnessed the development of enterprise wide networks composed of a multi-vendor environment containing heterogeneous protocol and hardware suites. Organizations have become increasingly dependent on these enterprise networks for their daily operations. This dependence has focussed attention on the need for operation, administration, maintenance, and provisioning (OAM&P) of the multi-vendor enterprise network on an end-to-end basis.

### 1.1 Background

This memo is part of a package of ISO/CCITT and Internet Management Coexistence (IIMC) drafts. Other memos included in this package are:

- Translation of Internet MIBs to ISO/CCITT GDMO MIBs (LaBarre) [IIMCIMIBTRANS]

- Translation of ISO/CCITT GDMO MIBs to Internet MIBs (Newnan) [IIMCOMIBTRANS]

- Translation of Internet Party MIB (RFC1353) to ISO/CCITT GDMO MIB (LaBarre) [IIMCPARTY]

- ISO/CCITT to Internet Management Proxy (Chang) [IIMCPROXY]

These memos together comprise a package aimed at integrating ISO/CCITT-based and Internet-based management systems. These memos are offered as input to coexistence and interworking efforts underway throughout the industry,including organizations such as:

- IETF OSI Internet Management (OIM),
- Network Management Forum Technology Convergence Team,
- X/Open Systems Management (SysMan),
- OIW Network Management Special Interest Group (NMSIG), and
- OSF Management Special Interest Group (MANSIG).

This work was initiated, in part, by NM Forum efforts to translate RFC 1214 for use with OMNIPoint 1 implementations. Through this effort, it became obvious that end-to-end management requires an integrated, unified view of the managed network, despite differences in management protocol and information structure. Integrated management can be facilitated by the development of "proxy" mechanisms which translate between functionally equivalent service, protocol, and SMI differences to create this unified view. MIB translation procedures can be used to support proxy management, as well as to take advantage of existing MIB definition and avoid duplication of effort. In this way, commercial investment in both ISO/CCITT and Internet-based management technologies can be preserved through deployment

of common methods and tools which support integration.

This overall strategy was outlined in a joint publication developed by the NM Forum and X/Open entitled "ISO/CCITT and Internet Management: Coexistence and Interworking Strategy" [NMFMC92]. The memos included in the IIMC package are intended as detailed specifications which implement several of the methodologies identified in this strategy.

**1.2 Overview**

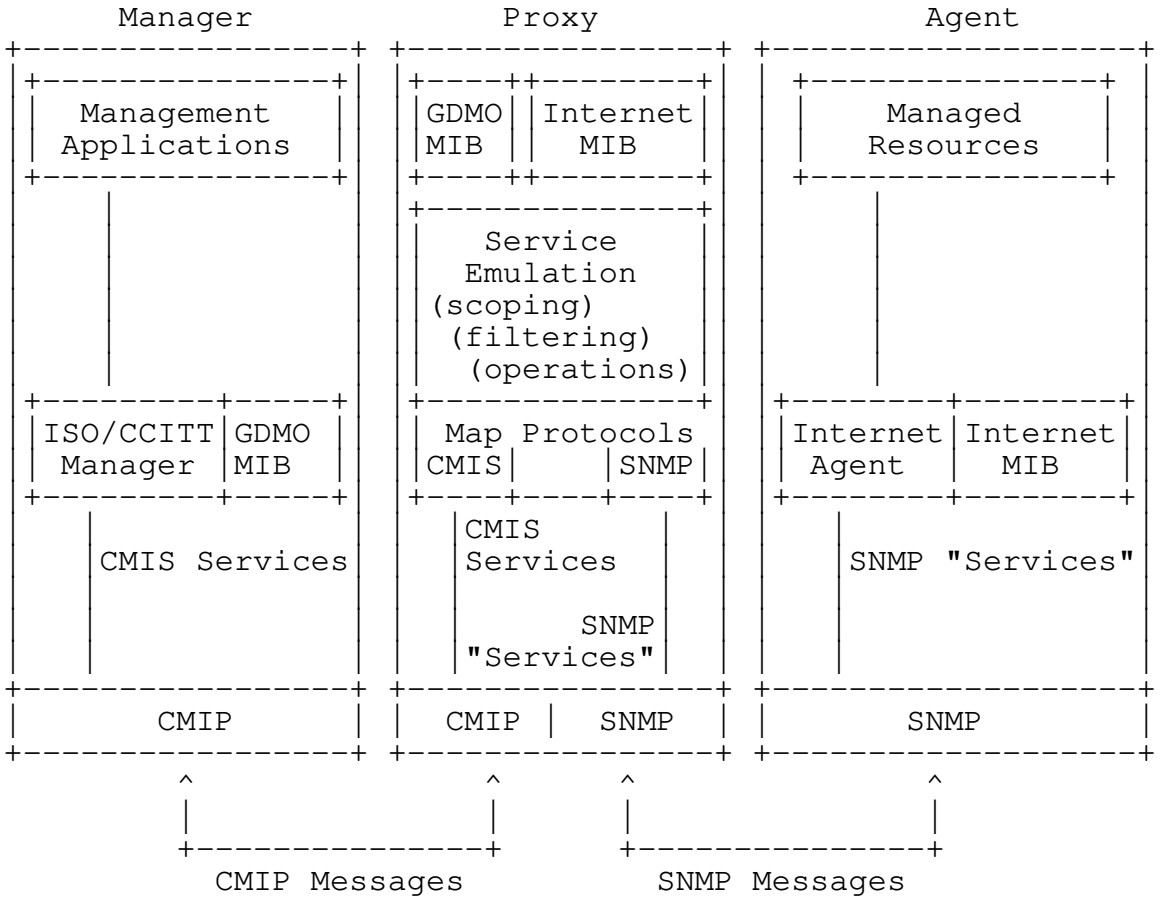
The response to the need for OAM&P of enterprise networks has been the development of network management standards within various networking communities - most notably the ISO/CCITT and Internet community. However, coordination of standards activities between these two communities has not occurred. As a result, although they share a nearly common management model, differences in their management protocols and structure of management Information (SMI) have developed due to differing management philosophies.

The ISO/CCITT community has developed the Common Management Information Protocol (CMIP) [ISO9596], and related SMI documents [ISO10165-1,3,4]. The Internet community has developed the Simple Network Management Protocol (SNMP) [RFC1157], and is developing its successor, SNMP-2, based on [SMPPROT]. The Internet SMI is defined in [RFC1155] and [SMPSMI]. Although functionally similar, the Internet and ISO/CCITT protocols and SMIs differ in terms of their complexity and specific operations.

The focus on the need for end-to-end enterprise management has indicated the need to integrate the management of components managed by ISO/CCITT management, Internet management and proprietary management mechanisms in a manner which presents a unified view of the network despite protocol and SMI differences. One way to integrate management is by the development of "proxy" mechanisms which translate between functionally equivalent services, protocol and SMI differences to create this unified view.

A body of telecommunications and computer vendors, represented by organizations such as the Network Management Forum (NMF), and the U.S. government, as specified in the Government Network Management Profile (GNMP) have based their integrated management model on the ISO/CCITT management model using CMIP and the ISO/CCITT SMI. These organizations are particularly interested in the development of proxies for devices that use the Internet management protocols and SMI. Their interest is primarily due to the widespread commercial implementation and use of such devices within their enterprises, especially devices that use the Internet TCP/IP protocol suite.

The basic model for ISO/CCITT-Internet proxy management is illustrated in the following diagram.



The proxy architecture provides emulation of CMIS services by mapping to the corresponding SNMP message(s) necessary to carry out the service request. The service emulation allows management of Internet objects by an ISO/CCITT manager. The left hand side of the proxy behaves like an ISO/CCITT agent, communicating with the ISO/CCITT manager using CMIP protocols. The right hand side of the proxy behaves like an Internet manager, communicating with the Internet agent using SNMP protocols.

The proxy relies on the existence of a pair of directly-related MIB definitions, where the Internet MIB has been translated into ISO/CCITT GDMO using the procedures specified in [IIMCMIBTRANS]. The proxy defined in [IIMCPROXY] uses these MIB definitions and rules to provide run-time translation of management information carried in service requests and responses.

The proxy architecture is designed with a specified interface between the proxy and the underlying protocol stacks, and so deals primarily in terms of CMIS services and

SNMP "services". The proxy emulates services such as CMIS scoping and filtering, processing of CMIS operations, and forwarding/logging of CMIS notifications by performing a mapping process which must be tailored for each protocol (for example, SNMP, Secure SNMP, and SNMP-2 are all variants of the same protocol mapping process).

Finally, [IIMCOMIBTRANS] specifies translation procedures for converting ISO/CCITT GDMO MIBs into Internet MIBs. MIBs generated by this translation process cannot be utilized by the Proxy defined in [IIMCPROXY], although another kind of Proxy could be defined for this purpose in the future.

### 1.3 Purpose and Scope

A major reason for the rapid commercialization of devices manageable via the Internet management protocol is due to the speed with which the vendors in the Internet community have been able to develop MIBs based on the Internet SMI. To capitalize on this continuing Internet MIB development and their deployment in commercial devices, communities interested in integrated management via CMIP/SNMP proxies require the translation of Internet MIBs defined according to the Internet Structure of Management Information (SMI) [RFC 1155] [SMPSMI] into MIBs defined according to the ISO SMI [ISO 10164-1] and Guidelines for the Definition of Managed Objects (GDMO) [ISO 10165-4]. Procedures for such translations are described in [IIMCIMIBTRANS].

This memo applies the procedures described in [IIMCIMIBTRANS] to the translation and registration of the Internet MIB-II as defined in [RFC1213], and to the IP Forwarding Table defined in [RFC1354].

This memo assumes that the reader is familiar with the ISO/CCITT SMI and terminology as well as the Internet to SMI translation defined in [IIMCIMIBTRANS].

### 1.4 Terms and Conventions

**TBD**

## 2. Object Class Definitions

The Internet MIB-II objects [RFC1213] are recast into ISO/CCITT GDMO templates as defined in ISO10165-4], and registered, using the procedures defined in [IIMCIMIBTRANS].

According to [IIMCIMIBTRANS], OIDs registered under the internet arc are of the form:

OID = <internet> <internetEntityId>

where <internet> is the full registration path to the "internet" arc; and <internetEntityId> is the portion of the OID that uniquely identifies entities under that arc, i.e., the remainder of the OID.

Re-registration of objects is accomplished by replacing the <internet> portion of the OID with a new registration arc allocated for proxy registration such that the OID is of the form:

```
     OID = <cmipsnmpProxyXX> <internetEntityId>
```

Accordingly, object class OIDs assigned in this document to [RFC1213] groups are:

```
cmipsnmpProxyIMIB
    |
    +--- mgmt (2) --- mib-2 (1) - system (1)
                                - interfaces (2)
                                - at (3)
                                - ip (4)
                                - icmp (5)
                                - tcp (6)
                                - udp (7)
                                - egp (8)
                                - transmission (10)
                                - snmp (11)
```

OIDs for additional object classes and attributes are extended from the above OIDs as is done in the corresponding Internet definitions. The object identifier {cmipsnmpProxyIMIB} is defined in [IIMCIMIBTRANS].

The templates for the OIM Proxy MIB-II object classes are listed in alphabetical order.

     MATCHES FOR    EQUALITY, ORDERING;
```

```
     BEHAVIOUR
          ipForwardPolicyBehaviour BEHAVIOUR
          DEFINED AS
          !The general set of conditions that
          would cause the  selection  of  one multipath
          route (set of next hops for a given destination)
          is  referred to as 'policy'.

              Unless the mechanism indicated by
          ipForwardProto specifies otherwise, the policy
          specifier is the IP TOS Field.  The encoding of
          IP TOS is as specified  by  the  following
          convention.  Zero indicates the default path if
          no more  specific policy applies.

        +-----+-----+-----+-----+-----+-----+-----+-----+
        |                 |                 |           |
        |   PRECEDENCE    | TYPE OF SERVICE |     0     |
        |                 |                 |           |
        +-----+-----+-----+-----+-----+-----+-----+-----+

               IP TOS                    IP TOS
         Field         Policy      Field        Policy
        Contents       Code        Contents     Code
         0 0 0 0  ==>   0           0 0 0 1  ==>   2
         0 0 1 0  ==>   4           0 0 1 1  ==>   6
         0 1 0 0  ==>   8           0 1 0 1  ==>  10
         0 1 1 0  ==>  12           0 1 1 1  ==>  14
         1 0 0 0  ==>  16           1 0 0 1  ==>  18
         1 0 1 0  ==>  20           1 0 1 1  ==>  22
         1 1 0 0  ==>  24           1 1 0 1  ==>  26
         1 1 1 0  ==>  28           1 1 1 1  ==>  30

          Protocols defining 'policy' otherwise must  ei-
          ther define a set of values which are valid for
          this  object  or  must  implement  an  integer-
          instanced  policy table for which this object's
          value acts as an index.!;;

ipForwardType ATTRIBUTE
```

```
     WITH ATTRIBUTE SYNTAX
          OIMRFC1213ProxyASN1.IpForwardType;
     MATCHES FOR    EQUALITY, ORDERING;
     BEHAVIOUR
          ipForwardTypeBehaviour BEHAVIOUR
          DEFINED AS
          !The type of route.  Note that local(3)  refers
          to  a route for which the next hop is the final
          destination; remote(4) refers to  a  route  for
          which the next hop is not the final destination.

          Setting this object to the value invalid(2) has
          the  effect  of  invalidating the corresponding
          entry in the ipForwardTable object.   That  is,
          it  effectively  disassociates  the destination
          identified with said entry from the route
          identified with said entry.  It is an
          implementation-specific matter  as  to
          whether the agent removes an invalidated
          entry from the table.  Accordingly,
          management  stations  must be prepared to
          receive tabular information from agents that
          corresponds to entries not currently  in  use.
          Proper interpretation of such entries requires
          examining the relevant ipForwardType object.!;;

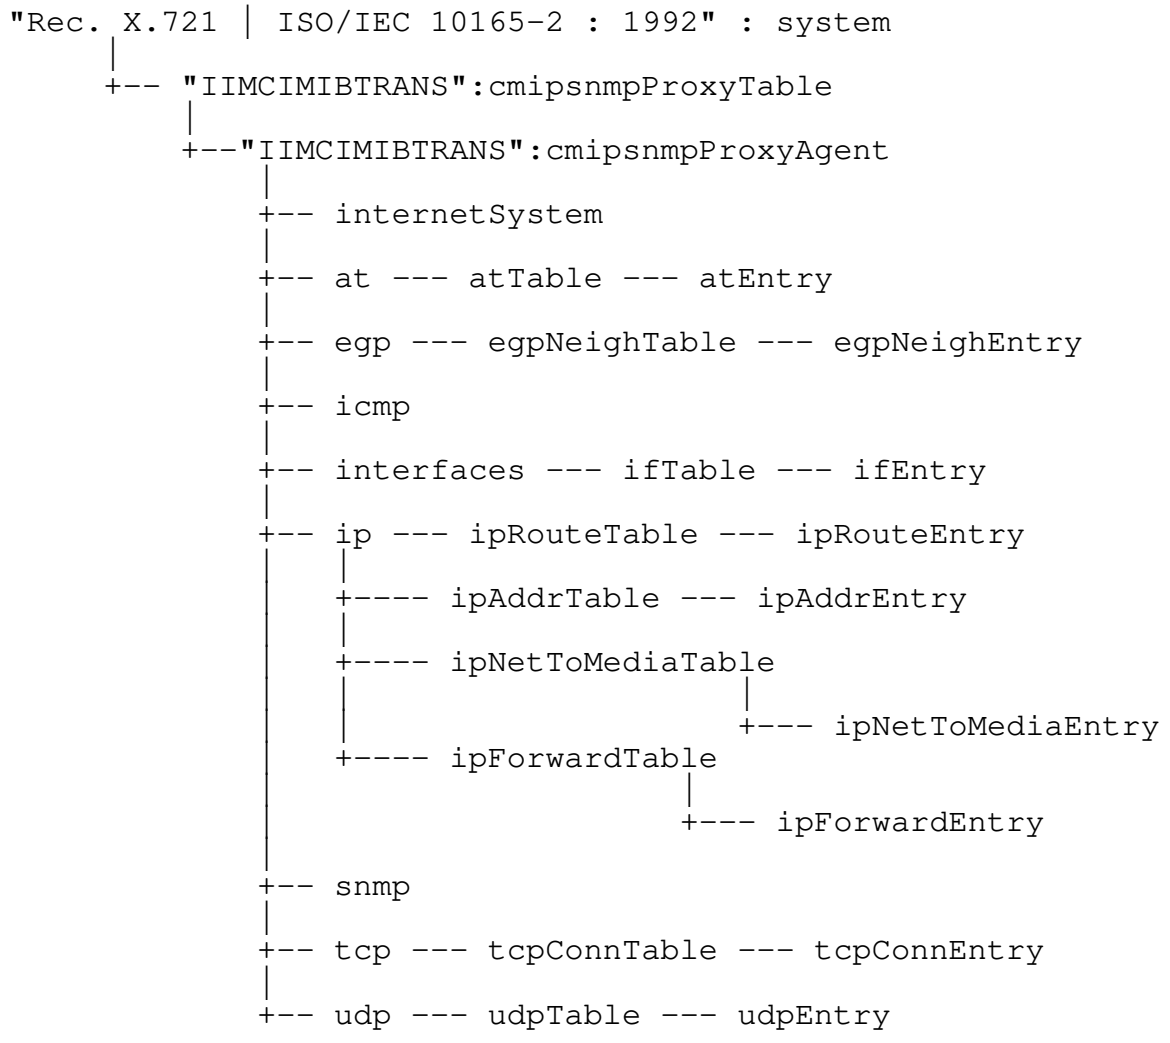
## 4. Notifications

No traps have been specified in Internet MIB-II [RFC1213].

## 5. The Containment Hierarchy

A Naming Tree diagram for OIM MIB-II managed object classes is illustrated below. Although the ISO/CCITT "system" object class is shown to be the root of the tree, other object classes may be used.



Name Binding templates that define the containment hierarchy for the ISO/CCITT MIB-II managed object classes are listed here in alphabetical order. The object identifier {cmipsnmpProxyNB} is defined in [IIMCIMIBTRANS]. Also defined in that document is the convention for creating OIDs for name bindings:

- Replace the {cmipsnmpProxyIMIB} portion of the ISO/CCITT defined OID for the object class, ..., with {cmipsnmpProxyNB <sub-dentifier>}. The integer <sub-identifier> is used to distinguish possible multiple name bindings for the same object class. Sub-identifier values shall be greater than or

equal to 1.

Since this defines the first name binding for each object defined in this MIB, the <integer> is 1. Consequently, all name binding OIDs begin with {cmipsnmpProxyNB 1}

```
